

NATIONAL POLICIES AND STRATEGY ON ENVIRONMENTAL PROTECTION, A CHALLENGE FOR CIVILIAN EMERGENCIES

The universe is created with all the necessary infrastructure, supplementing with water, land, man, animals, forests, seas, lakes, rivers, flora and fauna in order to be used, maintained and be in service for a long time, thousands and thousands of years.

The climate change has made part of the evergreen glaciers melt, increasing the level of waters in the oceans and seas. A part of the river broke away of the river bed causing massive flooding of the earth's surface.

Also, climate change has provided considerably higher temperatures throughout the globe, associated with powerful fires, burning and destroying thousands and thousands of acres of forests and pastures. Seabed rippling, rivers breaking away from their beds is associated with massive erosion of the earth, devouring a considerable surface, and altering the course and direction of river beds.

All these disorders come as a result of the violence, uncontrolled development by the modern industry and technology, created by disadvantages of manmade to protect and restore the environment, where the human himself lives. We then ask ourselves: *Are we able and should we preserve this environment by these gallop disorders caused by human himself and who will protect and restore it?!*
